Logging the Calls

- **Task**: Create a LoggingAspect class to log method calls within controllers.
- **Tools Used**:
  - LoggerFactory for logging.

Example:

```java
@Aspect
@Component
public class LoggingAspect {
    private static final Logger LOGGER =LoggerFactory.getLogger(LoggingAspect.class);

    @Before("execution (* com.telusko.springbootrest.service.JobService.*(..))")
    public void logMethodCall() {
        LOGGER.info("Method Called ");
    }

}
```

- **Explanation**: The @Before advice logs any method execution within the specified package. This is a starting point for integrating logging.
